# On a Two Components Condition for Regularity of the 3D Navier-Stokes Equations under Physical Slip Boundary Conditions on Non-Flat Boundaries 

H. Beirão da Veiga, J. Bemelmans ${ }^{\dagger}$ J. Brand ${ }^{\ddagger}$

July 19, 2018

#### Abstract

This work concerns the sufficient condition for the regularity of solutions to the evolution Navier-Stokes equations known in the literature as Prodi-Serrin condition. H.-O. Bae and H.J. Choe proved in 1997 that, in the whole space $\mathbb{R}^{3}$, it is sufficient that two components of the velocity satisfy the above condition in order to guarantee the regularity of solutions. In contribution [8], this result was extended to the half-space case $\mathbb{R}_{+}^{n}$ under slip boundary conditions by assuming that the velocity components parallel to the boundary enjoy the above condition. It remained open whether the flat boundary geometry is essential. Below, we prove that, under physical slip boundary conditions imposed in cylindrical boundaries, the result still holds.

## 1 Introduction. Related Results. The Main Problem.

To explain motivation, setting, and interest of the problem studied below, we start by recalling some well-known results. A sketch is sufficient to this purpose, since we assume that readers are acquainted with the main lines of the subject. Some results that are referred to below also hold for dimensions $n>3$. For simplicity, since we are interested in the case $n=3$ below, we do not refer to extensions to larger dimensions, except if strongly connected to our specific problem.

Consider the Navier-Stokes equations described in Cartesian coordinates

$$
\left\{\begin{array}{l}
\partial_{t} \mathbf{u}+(\mathbf{u} \cdot \nabla) \mathbf{u}-\nu \nabla^{2} \mathbf{u}+\nabla \pi=0  \tag{1.1}\\
\nabla \cdot \mathbf{u}=0 \quad \text { in } \Omega \times(0, T]
\end{array}\right.
$$

where $\Omega \subset \mathbb{R}^{3}$ is an open, smooth set. Below, weak solutions are considered in the so-called Leray-Hopf sense, see J. Leray in [24], E. Hopf in [18], and A.A. Kiselev and O.A. Ladyzhenskaya in [19], and also J.L. Lions in [25]. Solutions are called strong if

$$
\begin{equation*}
\mathbf{u} \in L^{\infty}\left(0, T ; W^{1,2}(\Omega)\right) \cap L^{2}\left(0, T ; W^{2,2}(\Omega)\right) \tag{1.2}
\end{equation*}
$$

A main point in the theory of the $3 D$ Navier-Stokes equations is that strong solutions are unique and smooth if data and domain are smooth as well. The result holds in a very large class of domains $\Omega$ if suitable boundary conditions, or behavior at infinity, are prescribed. To prove, or disprove, that weak solutions are necessarily strong (or unique) under reasonable but general assumptions, is one of the most challenging open mathematical problems.

[^0]In this context, a remarkable and classical sufficient condition for uniqueness and regularity is the so-called strict Prodi-Serrin (P-S) condition, namely

$$
\begin{equation*}
\mathbf{u} \in L^{q}\left(0, T ; L^{p}(\Omega)\right), \quad \frac{2}{q}+\frac{3}{p}=1, \quad p>3 \tag{1.3}
\end{equation*}
$$

Weak solutions satisfying the P-S condition (1.3) are known to be strong and unique.
Assumption (1.3) was firstly considered by G. Prodi in his paper [28] of 1959. He proved uniqueness under assumption (1.3), see also C. Foias, [13]. Furthermore, J. Serrin, see [30] and [31], particularly proved interior spatial regularity under the stronger (non-strict) assumption

$$
\begin{equation*}
\mathbf{u} \in L^{q}\left(0, T ; L^{p}(\Omega)\right), \quad \frac{2}{q}+\frac{3}{p}<1, \quad p>3 . \tag{1.4}
\end{equation*}
$$

Concerning the above problems, see also O.A. Ladyzenskaya's contributions [22] and [23]. The above setup led to the nomenclature Prodi-Serrin condition.

Complete proofs of the strict regularity result (i.e. under assumption (1.3)) were given by H. Sohr in [32], W. von Wahl in [34], and Y. Giga in [16]. A simplified version of the proof was given in [15]. We additionally recommend the references in the bibliography of this last paper. For a quite complete overview on the initial-boundary value problem see contribution [14].

More recently, L. Escauriaza, G. Seregin, and V. Šverák, see [12], extended the regularity result to the case $(q, p)=(\infty, 3)$.

We strongly recommend [29] and [31] as sources for information on the historical context of the $\mathrm{P}-\mathrm{S}$ condition by the initiators themselves.

A significant improvement of the P-S condition was obtained by H.-O. Bae and H.J. Choe. This is the main subject of our paper. These authors succeeded in proving that regularity also holds under the weaker assumption

$$
\begin{equation*}
\overline{\mathbf{u}} \in L^{q}\left(0, T ; L^{p}\left(\mathbb{R}^{3}\right)\right), \quad \frac{2}{q}+\frac{3}{p} \leq 1, \quad p>3, \tag{1.5}
\end{equation*}
$$

where $\overline{\mathbf{u}}$ is a vector consisting of two arbitrary components of $\mathbf{u}$. A complete proof of this result was shown in a preprint from 1999 by Bae and Choe, see also [1].

Furthermore, in contribution [8], this result was extended to the half-space $\mathbb{R}_{+}^{n}$ under slip boundary conditions. In this case, the truncated ( $n-1$ )-dimensional vector field $\overline{\mathbf{u}}$ cannot be chosen arbitrarily. The omitted component has to be normal to the boundary.

$$
\overline{\mathbf{u}}=\left(u_{1}, u_{2}, \ldots, u_{n-1}, 0\right) .
$$

The challenging question whether the assumption of a flat boundary was a crucial element for the proof remained open. In order to study this problem, we will consider, below, a cylindrical threedimensional domain, periodic in the axial direction, see §2. Equations are studied in cylindrical coordinates $\left(\xi_{1}, \xi_{2}, \xi_{3}\right)=(r, \vartheta, z)$ with obvious notation. Hence, the velocity's component normal to the lateral boundary $\partial^{l} \Omega$ of the cylinder is represented by $u_{1}$, and $\overline{\mathbf{u}}=\left(0, u_{2}, u_{3}\right)$ consists of the angular and the axial components of the velocity field. In order to better highlight the common features in the two approaches, Cartesian and cylindrical, we keep the same notation in both systems of coordinates. For instance, $\mathbf{u}$ and $\pi$ denote velocity and pressure, respectively, in both systems.

Our main result is Theorem 2.2 below. For definitions and notation, see $\S 2$.
After the contribution by Bae and Choe, related papers appeared that particularly concerned assumptions on two components of velocity or vorticity, see [2], [5], [8], [9], and [11]. There are also many papers dedicated to sufficient conditions for regularity which depend merely on one component, see, for instance, [10], [17], [21], [27], [35], and [36].

Next, we briefly consider the Prodi-Serrin condition for $(q, p)=(\infty, n)$. It deserves a separate treatment. Consult [12] and [26] for full results, and [4] and [20] for previous results. Concerning contributions in which the restricted P-S condition

$$
\begin{equation*}
\overline{\mathbf{u}} \in L^{\infty}\left(0, T ; L^{n}(\Omega)\right) \tag{1.6}
\end{equation*}
$$

is assumed, we refer to [5] and [9]. In both cases, $\Omega=\mathbb{R}^{n}$.

In contribution [5], it was shown that solutions are regular even under the condition that the norm $\|\overline{\mathbf{u}}(t)\|_{n}$ admits a sufficiently small discontinuity from the left. In other words, they cannot exist. More precisely, it was proved that there is a positive constant $C(n)$ such that the solution is smooth in $(0, T]$ if

$$
\begin{equation*}
\sup _{\tau \in(0, T]}\left(\left(\limsup _{t \rightarrow \tau-0}\|\overline{\mathbf{u}}(t)\|_{n}^{n}\right)-\|\overline{\mathbf{u}}(\tau)\|_{n}^{n}\right) \leq C(n) \nu^{n} . \tag{1.7}
\end{equation*}
$$

In particular, by setting $\tau=0$, it follows that $\|\overline{\mathbf{u}}\|_{L^{\infty}\left(0, T ; L^{n}\left(\mathbb{R}^{n}\right)\right)} \leq C(n) \nu$ implies regularity. In contribution [9], the author replaced the space $L^{n}\left(\mathbb{R}^{n}\right)$ by the weak $L^{n}$-Marcinkiewicz space $L_{w}^{n}\left(\mathbb{R}^{n}\right)$, endowed with the canonical quasi-norm $[v]_{n}$, and essentially proved that there is a positive constant $C$ such that a weak solution $\mathbf{u}$ is smooth in $(0, T]$ if it satisfies $\|\overline{\mathbf{u}}\|_{L^{\infty}\left(0, T ; L_{w}^{n}\left(\mathbb{R}^{n}\right)\right)} \leq C$.

For the reader's convenience, we briefly describe the main points of the classical proof of the sufficiency of the P-S condition for regularity in $\S 3$. The aim of this sketch is merely to provide additional assistance in comprehensively reading the more complicated situation that involves cylindrical coordinates. In this sense, it may be skipped by the reader.

## 2 The Navier-Stokes Equations in Cylindrical Coordinates. The Restricted P-S Condition. The Main Result.

In the sequel, we are interested in the evolution Navier-Stokes equations in the open bounded cylinder $\Omega \subset \mathbb{R}^{3}$, defined by

$$
\Omega:=\left(\rho_{0}, \rho_{1}\right) \times[0,2 \pi) \times(0,1),
$$

under the classical Navier slip boundary condition without friction, see below. It is convenient to study these equations in cylindrical coordinates $\left(\xi_{1}, \xi_{2}, \xi_{3}\right)$, where the radial coordinate $\xi_{1}$ has range

$$
\begin{equation*}
0<\rho_{0}<\xi_{1}<\rho_{1} \tag{2.1}
\end{equation*}
$$

the angular coordinate $\xi_{2}$ is $2 \pi$-periodic, and the component in axial direction $\xi_{3}$ is 1-periodic. We write

$$
\mathbf{u}=u_{1} \cdot \mathbf{e}_{1}+u_{2} \cdot \mathbf{e}_{2}+u_{3} \cdot \mathbf{e}_{3},
$$

where $\mathbf{e}_{k}, k=1,2,3$, are the unit vectors in radial, angular and axial (orthogonal) directions, respectively. We use the $\nabla$-symbol in the following manner, where $\mathbf{v}: \Omega \rightarrow \mathbb{R}^{3}$ is a vector field and $g: \Omega \rightarrow \mathbb{R}$ is a scalar field:

$$
\left\{\begin{align*}
& \nabla \cdot \mathbf{v}:=\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} v_{1}\right)+\frac{1}{\xi_{1}}\left(\partial_{2} v_{2}\right)+\partial_{3} v_{3},  \tag{2.2a}\\
& \nabla g:=\left(\partial_{1} g\right) \cdot \mathbf{e}_{1}+\frac{1}{\xi_{1}}\left(\partial_{2} g\right) \cdot \mathbf{e}_{2}+\left(\partial_{3} g\right) \cdot \mathbf{e}_{3}, \\
& \nabla^{2} g:= \frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} \partial_{1} g\right)+\frac{1}{\xi_{1}^{2}}\left(\partial_{2}^{2} g\right)+\left(\partial_{3}^{2} g\right), \\
& \nabla^{2} \mathbf{v}:=\left(\nabla^{2} v_{1}-\frac{2}{\xi_{1}^{2}} \partial_{2} v_{2}-\frac{v_{1}}{\xi_{1}^{2}}\right) \cdot \mathbf{e}_{1}+ \\
&\left(\nabla^{2} v_{2}+\frac{2}{\xi_{1}^{2}} \partial_{2} v_{1}-\frac{v_{2}}{\xi_{1}^{2}}\right) \cdot \mathbf{e}_{2}+ \\
&\left(\nabla^{2} v_{3}\right) \cdot \mathbf{e}_{3}, \\
& \mathbf{v} \cdot \nabla g:=v_{1}\left(\partial_{1} g\right)+\frac{v_{2}}{\xi_{1}}\left(\partial_{2} g\right)+v_{3}\left(\partial_{3} g\right) .
\end{align*}\right.
$$

Note that

$$
\begin{equation*}
\mathbf{v} \cdot(\nabla g)=(\mathbf{v} \cdot \nabla) g=v_{1}\left(\partial_{1} g\right)+\frac{v_{2}}{\xi_{1}}\left(\partial_{2} g\right)+v_{3}\left(\partial_{3} g\right) . \tag{2.3}
\end{equation*}
$$

The three-dimensional evolution Navier-Stokes equations in cylindrical coordinates, see [3, p. 602], are given by:

$$
\left\{\begin{array}{l}
\mathcal{E}_{1}:=\partial_{t} u_{1}+N_{1}-\nu\left(\nabla^{2} u_{1}-\frac{2}{\xi_{1}^{2}} \partial_{2} u_{2}-\frac{u_{1}}{\xi_{1}^{2}}\right)+\partial_{1} \pi=0  \tag{2.4}\\
\mathcal{E}_{2}:=\partial_{t} u_{2}+N_{2}-\nu\left(\nabla^{2} u_{2}+\frac{2}{\xi_{1}^{2}} \partial_{2} u_{1}-\frac{u_{2}}{\xi_{1}^{2}}\right)+\frac{1}{\xi_{1}} \partial_{2} \pi=0 \\
\mathcal{E}_{3}:=\partial_{t} u_{3}+N_{3}-\nu\left(\nabla^{2} u_{3}\right)+\partial_{3} \pi=0
\end{array}\right.
$$

The fluid's incompressibility is expressed by

$$
\begin{equation*}
\nabla \cdot \mathbf{u}=\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} u_{1}\right)+\frac{1}{\xi_{1}}\left(\partial_{2} u_{2}\right)+\left(\partial_{3} u_{3}\right)=0 \tag{2.5}
\end{equation*}
$$

$N_{1}, N_{2}$ and $N_{3}$ denote the three components of the non-linear term $(\mathbf{u} \cdot \nabla) \mathbf{u}$ in cylindrical coordinates, namely

$$
\left\{\begin{array}{l}
N_{1}:=\mathbf{u} \cdot \nabla u_{1}-\frac{u_{2}^{2}}{\xi_{1}}=u_{1}\left(\partial_{1} u_{1}\right)+\frac{u_{2}}{\xi_{1}}\left(\partial_{2} u_{1}\right)+u_{3}\left(\partial_{3} u_{1}\right)-\frac{u_{2}^{2}}{\xi_{1}}  \tag{2.6}\\
N_{2}:=\mathbf{u} \cdot \nabla u_{2}+\frac{u_{1} u_{2}}{\xi_{1}}=u_{1}\left(\partial_{1} u_{2}\right)+\frac{u_{2}}{\xi_{1}}\left(\partial_{2} u_{2}\right)+u_{3}\left(\partial_{3} u_{2}\right)+\frac{u_{1} u_{2}}{\xi_{1}} \\
N_{3}:=\mathbf{u} \cdot \nabla u_{3}=u_{1}\left(\partial_{1} u_{3}\right)+\frac{u_{2}}{\xi_{1}}\left(\partial_{2} u_{3}\right)+u_{3}\left(\partial_{3} u_{3}\right)
\end{array}\right.
$$

On the lateral boundary of the cylinder,

$$
\begin{equation*}
\partial^{l} \Omega:=\left\{\left(\xi_{1}, \xi_{2}, \xi_{3}\right): \xi_{1}=\rho_{0}, \rho_{1} ; \xi_{2} \in[0,2 \pi) ; \xi_{3} \in(0,1)\right\} \tag{2.7}
\end{equation*}
$$

we impose slip boundary conditions defined by requiring that the normal component of $\mathbf{u}$ vanishes, i.e. $u_{1} \equiv 0$, and that the tangential components of the stress vector vanish, too. By appealing to the tangent vector fields $\mathbf{e}_{2}$ and $\mathbf{e}_{3}$ on $\partial^{l} \Omega$ and to the stress vector

$$
\begin{equation*}
\left[-\pi+2\left(\partial_{1} u_{1}\right)\right] \cdot \mathbf{e}_{1}+\left[\frac{\left(\partial_{2} u_{1}\right)}{\xi_{1}}+\xi_{1}\left(\partial_{1} \frac{u_{2}}{\xi_{1}}\right)\right] \cdot \mathbf{e}_{2}+\left[\left(\partial_{3} u_{1}\right)+\left(\partial_{1} u_{3}\right)\right] \cdot \mathbf{e}_{3}, \tag{2.8}
\end{equation*}
$$

we get

$$
\left\{\begin{align*}
u_{1} & =0  \tag{2.9}\\
\partial_{1} \frac{u_{2}}{\xi_{1}} & =0 \\
\partial_{1} u_{3} & =0
\end{align*}\right.
$$

on $\partial^{l} \Omega$, because of $\partial_{2} u_{1} \equiv \partial_{3} u_{1} \equiv 0$ on $\partial^{l} \Omega$.
Note that we may assume $\Omega$ being a $\xi_{3}$-periodic cylinder, and so do not consider its base and top as parts of the boundary.

For a mathematical treatment of quite general physical slip boundary conditions imposed on smooth, but generic, boundaries, with applications to stationary (classical and generalized) Stokes systems, see reference [6]. See also [33]. Further, in reference [7], applications to evolution problems of the results shown in [6] are illustrated by some significant examples.
Definition 2.1. Let $\mathbf{u}$ be a weak solution of the Navier-Stokes equations given by (2.4) - (2.6). Set

$$
\overline{\mathbf{u}}=\left(0, u_{2}, u_{3}\right)
$$

We say that $\mathbf{u}$ satisfies the restricted Prodi-Serrin condition if

$$
\begin{equation*}
\overline{\mathbf{u}} \in L^{q}\left(0, T ; L^{p}(\Omega)\right), \quad \frac{2}{q}+\frac{3}{p} \leq 1, \quad p>3 \tag{2.10}
\end{equation*}
$$

holds.
In the sequel, we prove the following result.
Theorem 2.2. Let $\mathbf{u}$ be a weak solution of the Navier-Stokes equations given by (2.4) - (2.6) in the cylinder $\Omega$, subject to the slip boundary conditions (2.9). Furthermore, assume that $\mathbf{u}$ satisfies the restricted $P$-S condition (2.10). Then, $\mathbf{u}$ is a strong solution

$$
\begin{equation*}
\mathbf{u} \in L^{\infty}\left(0, T ; W^{1,2}(\Omega)\right) \cap L^{2}\left(0, T ; W^{2,2}(\Omega)\right) \tag{2.11}
\end{equation*}
$$

Strong solutions are smooth provided that data and domain are smooth as well.

## 3 Remarks on the Whole- and Half-Space Cases

The proof of Theorem 2.2 is quite intricate, particularly due to the appearance of many "lower order terms". We believe that an anticipatory knowledge of the main lines of the proof, in a simpler case, could help readers to follow the complete proof of the Theorem shown in the next sections. We try to accomplish this purpose by briefly describing the main points in the classical proof of the P-S condition's sufficiency for regularity, in the simplest case, namely $\Omega=\mathbb{R}^{n}$, in Cartesian coordinates. Our aim is merely to assist in the understanding of the more complicated situation involving cylindrical coordinates. In this sense, this section may be fully skipped by the reader.

To better highlight the common features in the two approaches, Cartesian and cylindrical, we stick to the same notation $(\mathbf{u}, \pi)$. Hence, we write

$$
\left\{\begin{array}{l}
\partial_{t} \mathbf{u}+(\mathbf{u} \cdot \nabla) \mathbf{u}-\nu \nabla^{2} \mathbf{u}+\nabla \pi=0  \tag{3.1}\\
\nabla \cdot \mathbf{u}=0 \quad \text { in } \Omega \times(0, T]
\end{array}\right.
$$

In this simplified case, the proof of (2.11) has the following structure. By differentiating both sides of the first equation in (3.1) with respect to $x_{k}, k=1,2,3$, by taking the scalar product with $\partial_{k} \mathbf{u}$, and by summing up over $k$, one shows that

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int|\nabla \mathbf{u}|^{2} \mathrm{~d} x+\nu \int\left|\nabla^{2} \mathbf{u}\right|^{2} \mathrm{~d} x=-\int \nabla[(\mathbf{u} \cdot \nabla) \mathbf{u}] \cdot \nabla \mathbf{u} \mathrm{d} x \tag{3.2}
\end{equation*}
$$

where obvious integrations by parts have been done, and $\nabla \cdot \mathbf{u}=0$ was taken into account. On the other hand, an integration by parts yields

$$
\begin{equation*}
\left|\int \nabla[(\mathbf{u} \cdot \nabla) \mathbf{u}] \cdot \nabla \mathbf{u} \mathrm{d} x\right| \leq c(n) \int|\mathbf{u}||\nabla \mathbf{u}|\left|\nabla^{2} \mathbf{u}\right| \mathrm{d} x \tag{3.3}
\end{equation*}
$$

From (3.2) and (3.3), it follows that

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int|\nabla \mathbf{u}|^{2} \mathrm{~d} x+\nu \int\left|\nabla^{2} \mathbf{u}\right|^{2} \mathrm{~d} x \leq c(n) \int|\mathbf{u}||\nabla \mathbf{u}|\left|\nabla^{2} \mathbf{u}\right| \mathrm{d} x \tag{3.4}
\end{equation*}
$$

Hence,

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int|\nabla \mathbf{u}|^{2} \mathrm{~d} x+\nu \int\left|\nabla^{2} \mathbf{u}\right|^{2} \mathrm{~d} x \leq c(n)\||\mathbf{u}| \nabla \mathbf{u}\|_{2}\left\|\nabla^{2} \mathbf{u}\right\|_{2} \tag{3.5}
\end{equation*}
$$

By Hölders inequality, one has

$$
\||\mathbf{u}| \nabla \mathbf{u}\|_{2} \leq\|\mathbf{u}\|_{p}\|\nabla \mathbf{u}\|_{\frac{2 p}{p-2}}
$$

Furthermore, by interpolation and by Sobolev's embedding theorem,

$$
\|\nabla \mathbf{u}\|_{\frac{2 p}{p-2}} \leq\|\nabla \mathbf{u}\|_{2}^{1-\frac{n}{p}}\|\nabla \mathbf{u}\|_{2^{*}}^{\frac{n}{p}} \leq c\|\nabla \mathbf{u}\|_{2}^{1-\frac{n}{p}}\left\|\nabla^{2} \mathbf{u}\right\|_{2}^{\frac{n}{p}}
$$

since $(p-2) /(2 p)=(1-n / p) / 2+(n / p) / 2^{*}$. Here, $2^{*}=2 n /(n-2)$ is the well-known exponent in Sobolev's embedding theorem. Consequently,

$$
\||\mathbf{u}| \nabla \mathbf{u}\|_{2}\left\|\nabla^{2} \mathbf{u}\right\|_{2} \leq c\|\mathbf{u}\|_{p}\|\nabla \mathbf{u}\|_{2}^{1-\frac{n}{p}}\left\|\nabla^{2} \mathbf{u}\right\|_{2}^{1+\frac{n}{p}}
$$

Hence, by Young's inequality,

$$
\begin{equation*}
\||\mathbf{u}| \nabla \mathbf{u}\|_{2}\left\|\nabla^{2} \mathbf{u}\right\|_{2} \leq C(\varepsilon)\|\mathbf{u}\|_{p}^{q}\|\nabla \mathbf{u}\|_{2}^{2}+\varepsilon\left\|\nabla^{2} \mathbf{u}\right\|_{2}^{2} \tag{3.6}
\end{equation*}
$$

From (3.5) and (3.6), we get, for $t \in(0, T]$,

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\|\nabla \mathbf{u}\|_{2}^{2}+\frac{\nu}{2}\left\|\nabla^{2} \mathbf{u}\right\|_{2}^{2} \leq C(\varepsilon)\|\mathbf{u}\|_{p}^{q}\|\nabla \mathbf{u}\|_{2}^{2}+\varepsilon\left\|\nabla^{2} \mathbf{u}\right\|_{2}^{2} \tag{3.7}
\end{equation*}
$$

Finally, (2.11) is proved by appealing to Gronwall's Lemma, since, by the classical version of the P-S condition,

$$
\|\mathbf{u}\|_{p}^{q} \in L^{1}(0, T)
$$

The crucial contribution of H.-O. Bae and H.J. Choe was to succeed in replacing, in the right hand side of (3.3), the term $|\mathbf{u}|$ simply by $|\overline{\mathbf{u}}|$, where $\overline{\mathbf{u}}=\left(u_{1}, u_{2}, \ldots, u_{n-1}, 0\right)$. So

$$
\begin{equation*}
\left|\int \nabla[(\mathbf{u} \cdot \nabla) \mathbf{u}] \cdot \nabla \mathbf{u} \mathrm{d} x\right| \leq c(n) \int|\overline{\mathbf{u}}||\nabla \mathbf{u}|\left|\nabla^{2} \mathbf{u}\right| \mathrm{d} x \tag{3.8}
\end{equation*}
$$

holds instead of the weaker estimate (3.3). The reader immediately verifies that all the above calculations hold simply by replacing $\mathbf{u}$ by $\overline{\mathbf{u}}$ in the appropriate places. In particular, the inequality (3.7) holds with $\|\mathbf{u}\|_{p}^{q}$ replaced by $\|\overline{\mathbf{u}}\|_{p}^{q}$. This leads to the generalized P-S condition

$$
\begin{equation*}
\|\overline{\mathbf{u}}\|_{p}^{q} \in L^{1}(0, T) \tag{3.9}
\end{equation*}
$$

## 4 Structure and Method of Proof of Theorem 2.2

In order to prove Theorem 2.2, we start from the integral identities
which follow immediately from equations (2.4). To exploit incompressibility, we have to combine the above equations in the following manner:

$$
\begin{equation*}
I_{j, 1}(\mathcal{E})+I_{j, 2}(\mathcal{E})+I_{j, 3}(\mathcal{E})=0, \quad j=1,2,3 . \tag{4.2}
\end{equation*}
$$

Note that $\mathcal{E}_{k}, k=1,2,3$, consist of four distinct terms, time, non-linear, viscous, and pressure, respectively. This leads to the following decomposition of the integrals appearing in equations (4.1).

$$
\begin{equation*}
I_{j, k}(\mathcal{E})=I_{j, k}(N)+I_{j, k}(\pi)+I_{j, k}(\nu)+I_{j, k}(\partial t) \tag{4.3}
\end{equation*}
$$

The integrals on the right hand side will be studied separately. Just at the end of this paper, we will put all together by appealing to the core identity

$$
\begin{equation*}
\sum_{j, k=1,2,3} I_{j, k}(\mathcal{E})=0 . \tag{4.4}
\end{equation*}
$$

Roughly, we will prove in the next sections that the time terms give rise to the first term in the left hand side of (3.5), the viscous terms generate the second term, the pressure terms vanish, and the non-linear terms give rise to the right hand side of (3.5), obviously with $|\mathbf{u}|$ replaced by $|\overline{\mathbf{u}}|$. This leads to (3.7), with $\|\mathbf{u}\|_{p}^{q}$ replaced by $\|\overline{\mathbf{u}}\|_{p}^{q}$. However, in our cylindrical setting, this identification is possible only up to the appearance of a large number of negligible terms, see below.

Convention 4.1. In the sequel, claiming that some quantity $H(t)$ is negligible means that one can show, without appealing to the restricted $P$-S condition (2.10), that, given an arbitrary $\varepsilon>0$, there is a real function $b_{\varepsilon}(t) \in L^{1}(0, T)$, such that

$$
\begin{equation*}
|H(t)| \leq b_{\varepsilon}(t)\left(\|\mathbf{u}\|_{2}^{2}+\|\mathrm{D} \mathbf{u}\|_{2}^{2}\right)+\varepsilon\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2} \tag{4.5}
\end{equation*}
$$

a.e. in (0,T).

Terms that generate negligible terms after integration over $\Omega$ are also called negligible and may, thus, be eliminated from equations.

If an equality or an estimate holds up to negligible terms, we will write $\simeq$ or $\preceq$, respectively.
Due to the integrability of the function $b_{\varepsilon}(t)$, negligible terms $H(t)$ are trivially controlled by our main left hand side by appealing to Gronwall's Lemma - equation (3.7) shows the typical situation where now the above term $|H(t)|$ appears on the left hand side.

The above convention is useful, since it allows us to avoid many similar calculations and unnecessarily long equations as the verification of the negligibility of many quantities becomes routine and may be left to the reader.

We could give simple expressions, case by case, for the above functions $b_{\varepsilon}(t)$, see Lemma 4.2 below for examples. However, by appealing to a generic $b_{\varepsilon}$, we invite the reader to retrace these simple calculations on his own.

Note that the above convention is quite significant in the context of the P-S condition as it separates terms requiring this extra assumption from terms that can be treated without appealing to it.

Lemma 4.2. Terms of the following forms are negligible:

$$
\left\{\begin{array}{l}
u^{3},  \tag{4.6a}\\
u^{2}(\partial u), \\
u^{2}\left(\partial^{2} u\right), \\
u(\partial u)^{2}, \text { and } \\
(\partial u)\left(\partial^{2} u\right)
\end{array}\right.
$$

Furthermore,

$$
\begin{equation*}
\|\mathbf{u} \cdot \mathrm{D} \mathbf{u}\|_{2} \leq c\left(\|\mathbf{u}\|_{2}+\|\mathrm{D} \mathbf{u}\|_{2}\right)^{3 / 2}\left(\|\mathrm{D} \mathbf{u}\|_{2}^{1 / 2}+\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{1 / 2}\right) . \tag{4.7}
\end{equation*}
$$

Products of functions that are bounded by terms in (4.6) are still negligible.
Proof. The term (4.6e) is clearly bounded by the right hand side of (4.5) with $b_{\varepsilon}(t)=\varepsilon^{-1}$. The term (4.6d) can be estimated by appealing to Hölder's inequality with exponents 3 , 2, and 6 , and to Sobolev's embedding theorem $W^{1,2} \subset L^{6}$ applied to Du. It follows that

$$
\begin{aligned}
\int_{0}^{1} \int_{0}^{12 \pi} \int_{\rho_{0}}^{2}|u| \cdot|\partial u| \cdot|\partial u| \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} & \leq c\|\mathbf{u}\|_{3}\|\mathrm{D} \mathbf{u}\|_{2}\|\mathrm{D} \mathbf{u}\|_{6} \\
& \leq c\|\mathbf{u}\|_{3}\|\mathrm{D} \mathbf{u}\|_{2}\left(\|\mathrm{D} \mathbf{u}\|_{2}+\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}\right) \\
& \leq c\|\mathbf{u}\|_{3}\|\mathrm{D} \mathbf{u}\|_{2}^{2}+\frac{c}{\varepsilon}\|\mathbf{u}\|_{3}^{2}\|\mathrm{Du}\|_{2}^{2}+\varepsilon\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}
\end{aligned}
$$

The coefficient $\|\mathbf{u}\|_{3}^{2} \leq c\|\mathbf{u}\|_{6}^{2} \in L^{1}(0, T)$ satisfies condition (4.5) without appealing to the restricted P-S condition (2.10) as Leray-Hopf solutions belong to $L^{2}\left(0, T ; W^{1,2}(\Omega)\right)$. Similarly, the term (4.6c) may be bounded as follows.

$$
\begin{aligned}
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}|u| \cdot|u| \cdot\left|\partial^{2} u\right| \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} & \leq c\|\mathbf{u}\|_{3}\|\mathbf{u}\|_{6}\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2} \\
& \leq c\|\mathbf{u}\|_{3}\left(\|\mathbf{u}\|_{2}+\|\mathrm{D} \mathbf{u}\|_{2}\right)\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2} \\
& \leq \frac{c}{\varepsilon}\|\mathbf{u}\|_{3}^{2}\left(\|\mathbf{u}\|_{2}^{2}+\|\mathrm{Du}\|_{2}^{2}\right)+\varepsilon\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}
\end{aligned}
$$

The terms (4.6a) and (4.6b) are bounded by $c\|\mathbf{u}\|_{3}\left(\|\mathbf{u}\|_{2}^{2}+\|\mathrm{D} \mathbf{u}\|_{2}^{2}\right)$.
Equation (4.7) will be used much later only. Since the proof follows the same ideas, it seems appropriate to state it right away for the reader's convenience. By Hölder's inequality with exponents 3 and $3 / 2$, one shows that $\|\mathbf{u} \cdot \mathrm{Du}\|_{2} \leq\|\mathbf{u}\|_{6}\|\mathrm{Du}\|_{3}$. Furthermore, by interpolation, we obtain the relation $\|\mathrm{D} \mathbf{u}\|_{3}^{2} \leq\|\mathrm{D} \mathbf{u}\|_{2}\|\mathrm{D} \mathbf{u}\|_{6}$. On the other hand, $\|\mathbf{u}\|_{6} \leq c\left(\|\mathbf{u}\|_{2}+\|\mathrm{Du}\|_{2}\right)$, similarly for $\|\mathrm{Du}\|_{6}$. The estimate (4.7) now follows easily. The last claim in the Lemma is obvious.

Note that, with regard to the boundary condition for $u_{2}$ that we consider, the quantity $\|\mathrm{Du}\|_{2}$ is merely a semi-norm. This led to the addition of $\|\mathbf{u}\|_{2}$.

It is worth noting that Hölder and Sobolev theorems, due to (2.1), hold in $\Omega$ in the context of cylindrical coordinates, formally as for Cartesian coordinates, at most with an obvious adaptation.

## 5 Contribution of the Non-Linear Terms

We start by remarking that the role of the non-linear terms is central here, since the P-S condition is necessary especially because of these terms.

In this section, we study the integrals obtained by restricting the terms $\mathcal{E}_{1}, \mathcal{E}_{2}, \mathcal{E}_{3}$ in (4.1) to their non-linear parts, i.e. $N_{1}, N_{2}$, and $N_{3}$, respectively. Thus, we consider

$$
\left\{\begin{array}{l}
I_{1,1}(N):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left[\partial_{1}\left(\xi_{1} N_{1}\right)\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{5.1}\\
I_{1,2}(N):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{1}\left[\partial_{1}\left(\xi_{1} N_{2}\right)\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
I_{1,3}(N):=\int_{0}^{2 \pi \rho_{1}} \int_{0} \int_{\rho_{0}}\left[\partial_{1} N_{3}\right] \cdot\left[\partial_{1} u_{3}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
I_{j, k}(N):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{j} N_{k}\right] \cdot\left[\partial_{j} u_{k}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, j=2,3, k=1,2,3
\end{array}\right.
$$

We start by investigating the integrands

$$
\left\{\begin{array}{l}
N_{1,1}:=\left[\partial_{1}\left(\xi_{1} N_{1}\right)\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1}  \tag{5.2}\\
N_{1,2}:=\left[\partial_{1}\left(\xi_{1} N_{2}\right)\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \cdot \xi_{1} \\
N_{1,3}:=\left[\partial_{1} N_{3}\right] \cdot\left[\partial_{1} u_{3}\right] \cdot \xi_{1}, \\
N_{j, k}:=\left[\partial_{j} N_{k}\right] \cdot\left[\partial_{j} u_{k}\right] \cdot \xi_{1}, j=2,3, k=1,2,3
\end{array}\right.
$$

and by replacing the quantities $N_{k}, k=1,2,3$, by their definitions from (2.6). In this way, each $N_{j, k}$ appears as a sum of single terms which are trilinear in $u$, possibly with coefficients consisting of powers of $\xi_{1}$. This claim is obvious. Hence, we may decompose each $N_{j, k}$ in the following manner:

$$
\begin{equation*}
N_{j, k}=B_{j, k}+K_{j, k}+R_{j, k}, j, k=1,2,3, \tag{5.3}
\end{equation*}
$$

where, up to negligible terms (cf. Remark 5.1), $B_{j, k}$ denotes the summation of all terms having a factor of the form $u(\partial u)(\partial \partial u)$, and $K_{j, k}$ consists of all terms containing a factor of the form $(\partial u)(\partial u)(\partial u)$. It is worth noting that the really significant terms are the $B_{j, k^{-}}$and the $K_{j, k}$-terms, since they are characterized by three differentiations. The sums of all other terms which have, at most, two differentiations, are denoted by $R_{j, k}, j, k=1,2,3$.
Remark 5.1. In the sequel, some negligible terms will be dropped from the expressions of the $B_{j, k}$ - and the $K_{j, k}$-terms without changing notation. However, the definition (5.7) is strict due to the equality required in (5.9). On the contrary, the definition of the $K_{j, k}$-terms shown in (5.8) is neither strict nor particularly significant. To this extent, note that, in (5.14), one has a $\preceq-$ sign.

We now proceed to prove the negligibility of $R_{j, k}$-terms.
Proposition 5.2. The $R_{j, k}$-terms, $j, k=1,2,3$, are negligible.
Proof. Since every term in $N_{j, k}, j, k=1,2,3$, is trilinear in $u$, the residual terms $R_{j, k}$ must fall into one of the five categories of terms given in (4.6), possibly multiplied by an integer power of $\xi_{1}$. Due to this particular form, these coefficients remain in the very same class after differentiation. Furthermore, coefficients in this class are bounded, cf. (2.1). The Proposition becomes immediate by appealing to (4.6a) - (4.6d): The negligibility of these expressions has been shown in Lemma 4.2.

Clearly, in order to eliminate the $\varepsilon$-term from the right hand side of estimates like (3.6), we need a suitable estimate of the term $\left\|D^{2} \mathbf{u}\right\|_{2}^{2}$, present on the left hand side of (3.4). This crucial estimate will be obtained from the viscous $\nu$-terms in $\S 7$.

Next, note that, in equations (2.6), the terms $u_{2}^{2} / \xi_{1}$ and $\left(u_{1} u_{2}\right) / \xi_{1}$ give rise to negligible terms. Thus, we drop these terms from the expression of $N_{1}$ and $N_{2}$ :

$$
\begin{equation*}
N_{k} \simeq(\mathbf{u} \cdot \nabla) u_{k}, k=1,2,3 . \tag{5.4}
\end{equation*}
$$

Suitable expressions for the $B_{j, k^{-}}$and the $K_{j, k^{-}}$-terms can easily be obtained as follows. One starts by noting that, in equations (5.2), each time we differentiate a coefficient with respect to $\xi_{1}$, we obtain a negligible term. Thus,

$$
\begin{equation*}
N_{j, k} \simeq\left(\partial_{j} N_{k}\right)\left(\partial_{j} u_{k}\right) \xi_{1} \simeq\left[\partial_{j}\left(\mathbf{u} \cdot \nabla u_{k}\right)\right]\left(\partial_{j} u_{k}\right) \xi_{1}, \tag{5.5}
\end{equation*}
$$

where we also have appealed to the equivalence (5.4). Hence,

$$
\begin{align*}
N_{j, k} \simeq & {\left[\mathbf{u} \cdot \nabla\left(\partial_{j} u_{k}\right)\right]\left(\partial_{j} u_{k}\right) \xi_{1} } \\
& +\left[\left(\partial_{j} u_{1}\right)\left(\partial_{1} u_{k}\right)+\left(\partial_{j} \frac{u_{2}}{\xi_{1}}\right)\left(\partial_{2} u_{k}\right)+\left(\partial_{j} u_{3}\right)\left(\partial_{3} u_{k}\right)\right]\left(\partial_{j} u_{k}\right) \xi_{1} \\
\simeq & \frac{\xi_{1}}{2} \mathbf{u} \cdot \nabla\left[\left(\partial_{j} u_{k}\right)^{2}\right]  \tag{5.6}\\
& +\left[\left(\partial_{j} u_{1}\right)\left(\partial_{1} u_{k}\right)+\frac{1}{\xi_{1}}\left(\partial_{j} u_{2}\right)\left(\partial_{2} u_{k}\right)+\left(\partial_{j} u_{3}\right)\left(\partial_{3} u_{k}\right)\right]\left(\partial_{j} u_{k}\right) \xi_{1},
\end{align*}
$$

where we have appealed to (2.3) and to the fact that $\partial_{j} \xi_{1}^{-1}$ gives rise to a negligible term (which vanishes if $j \neq 1$.)

The first term on the right hand side of (5.6) denotes the explicit form of the $B_{j, k}$-terms:

$$
\begin{equation*}
B_{j, k}=\frac{\xi_{1}}{2} \mathbf{u} \cdot \nabla\left[\left(\partial_{j} u_{k}\right)^{2}\right] . \tag{5.7}
\end{equation*}
$$

To fix ideas, we choose the second term in (5.6) as being the explicit form of the $K_{j, k}$-terms,

$$
\begin{equation*}
K_{j, k}=\left[\xi_{1}\left(\partial_{j} u_{1}\right)\left(\partial_{1} u_{k}\right)+\left(\partial_{j} u_{2}\right)\left(\partial_{2} u_{k}\right)+\xi_{1}\left(\partial_{j} u_{3}\right)\left(\partial_{3} u_{k}\right)\right]\left(\partial_{j} u_{k}\right) . \tag{5.8}
\end{equation*}
$$

We now prove that the $B_{j, k}$-terms do not contribute to the integrals (5.1). The following identity holds.

Proposition 5.3. One has

$$
\begin{equation*}
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi} B_{j, k} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0, j, k=1,2,3 \tag{5.9}
\end{equation*}
$$

The result follows from the following statement.
Lemma 5.4. Let $g$ be a scalar field that is $2 \pi$-periodic with respect to $\xi_{2}$ and 1-periodic with respect to $\xi_{3}$. Then, there holds

$$
\begin{equation*}
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2}(\mathbf{u} \cdot \nabla g) \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0 \tag{5.10}
\end{equation*}
$$

Proof. Integration by parts yields

$$
\begin{aligned}
\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} u_{1}\left(\partial_{1} g\right) \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} & =\iint_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left(\xi_{\rho_{0}} u_{1}\right)\left(\partial_{1} g\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& =-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left(\xi_{1} u_{1}\right) g \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{aligned}
$$

since the corresponding boundary integral vanishes due to the boundary condition $u_{1}=0$ on the lateral boundary.

Similarly,

$$
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi \rho_{1}} \frac{u_{2}}{\xi_{1}}\left(\partial_{2} g\right) \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=-\int_{0}^{1} \int_{0}^{2 \pi \rho_{\rho_{1}}}\left(\partial_{2} u_{2}\right) g \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3},
$$

and

$$
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi} u_{3}\left(\partial_{3} g\right) \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \xi_{1}\left(\partial_{3} u_{3}\right) g \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3},
$$

since the boundary integrals vanish due to periodicity in $\xi_{2}$ or $\xi_{3}$, respectively.
Adding up the three above equations, it follows that

$$
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2}(\mathbf{u} \cdot \nabla) g \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=-\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi}(\nabla \cdot \mathbf{u}) \cdot g \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0
$$

and equation (5.10) is proved.
The reader should take note that the main ingredient for the estimate of the $B_{j, k}$-terms was the incompressibility of the velocity $\mathbf{u}$. The weak P-S condition was not used. It will be used, though, while considering the $K_{j, k}$-terms in order to prove the following result.

Proposition 5.5. One has

$$
\begin{align*}
& \left|\int_{0}^{1} \int_{0}^{2 \pi \rho_{\rho_{0}}} K_{j, k} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}\right| \\
& \preceq c \cdot \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}|\bar{u}||\mathrm{Du}|\left|\mathrm{D}^{2} \mathbf{u}\right| \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, \quad j, k=1,2,3 \tag{5.11}
\end{align*}
$$

where $\bar{u}$ may denote the angular component $u_{2}$ or the axial component $u_{3}$ of the velocity.
Proof. For arbitrary but fixed $j, k=1,2,3$, the three parts of $K_{j, k}$ have the particular form

$$
\begin{equation*}
a\left(\xi_{1}\right)\left(\partial_{j} u_{i}\right)\left(\partial_{i} u_{k}\right)\left(\partial_{j} u_{k}\right), i=1,2,3, \tag{5.12}
\end{equation*}
$$

where $a\left(\xi_{1}\right)=1$ or $a\left(\xi_{1}\right)=\xi_{1}$. Hence, in order to prove Proposition 5.5, it is sufficient to show that

$$
\begin{align*}
& \left|\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} a\left(\xi_{1}\right)\left(\partial_{j} u_{i}\right)\left(\partial_{i} u_{k}\right)\left(\partial_{j} u_{k}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}\right| \\
& \preceq c \cdot \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}|\bar{u}||\mathrm{Du}|\left|\mathrm{D}^{2} \mathbf{u}\right| \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{5.13}
\end{align*}
$$

for each triad of indices $i, j, k$.
Assume that the term $\partial_{2} u_{2}$ is present in the left hand side of (5.13). Then, after integrating by parts with respect to the angular variable $\xi_{2}$, one gets

$$
\begin{aligned}
& \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} a\left(\xi_{1}\right)\left(\partial_{j} u_{i}\right)\left(\partial_{i} u_{k}\right)\left(\partial_{j} u_{k}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& =-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} a\left(\xi_{1}\right) \partial_{2}\left[\left(\partial_{*} u_{*}\right)\left(\partial_{*} u_{*}\right)\right] u_{2} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{aligned}
$$

since the corresponding boundary integral vanishes due to $\xi_{2}$-periodicity. Take note that the factor $\left(\partial_{*} u_{*}\right)\left(\partial_{*} u_{*}\right)$ must be of the the form $\left(\partial_{2} u_{k}\right)\left(\partial_{2} u_{k}\right),\left(\partial_{j} u_{2}\right)\left(\partial_{j} u_{2}\right)$, or $\left(\partial_{2} u_{i}\right)\left(\partial_{i} u_{2}\right)$. This already proves (5.13) with $\bar{u}=u_{2}$ (and $c=\rho_{1}$ or $c=a\left(\rho_{1}\right)$ ).

A similar proof applies if we assume that the term $\partial_{3} u_{3}$ is present in the left hand side of (5.13). In this case, we appeal to the $\xi_{3}$-periodicity.

Next, assume that the term $\partial_{1} u_{1}$ is present in the left hand side of (5.13). As $\mathbf{u}$ is incompressible, we may now replace $\partial_{1} u_{1}$ by

$$
-\frac{u_{1}}{\xi_{1}}-\frac{\partial_{2} u_{2}}{\xi_{1}}-\partial_{3} u_{3}
$$

The expression coming from $u_{1} / \xi_{1}$ is negligible. The other two are treated as above.
If the left hand side of equation (5.13) does not fall into one of the above three cases, then, necessarily, the three indices $i, j, k$ are pairwise distinct. One easily verifies that, in this case, at least one of the two terms $\partial_{2} u_{3}$ or $\partial_{3} u_{2}$ must be present. In the first case, we integrate by parts with respect to $\xi_{2}$, and we end up with $\bar{u}=u_{3}$ in equation (5.13). The boundary integral vanishes due to $\xi_{2}$-periodicity. The second case is similar and the argumentation reads as above if we interchange the indices 2 and 3 .

Equation (5.3) and Propositions 5.2, 5.3 and 5.5 lead to the following result.

## Proposition 5.6. One has

$$
\begin{align*}
\left|I_{j, k}(N)\right| & =\left|\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi} N_{j, k} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}\right| \\
& \preceq c \cdot \iint_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}|\bar{u}||\mathrm{Du}|\left|\mathrm{D}^{2} \mathbf{u}\right| \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, \quad j, k=1,2,3 \tag{5.14}
\end{align*}
$$

where $\bar{u}$ may denote the angular component $u_{2}$ or the axial component $u_{3}$ of the velocity.
By arguing as in the proof of (3.6) with $|\mathbf{u}|$ replaced by $|\overline{\mathbf{u}}|$, we prove the following result.
Theorem 5.7. One has

$$
\begin{equation*}
\left|I_{j, k}(N)\right| \preceq C(\varepsilon)\|\overline{\mathbf{u}}\|_{p}^{q}\|\mathrm{D} \mathbf{u}\|_{2}^{2}+\varepsilon\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}, j, k=1,2,3 . \tag{5.15}
\end{equation*}
$$

Recall that, due to Convention 4.1, we may replace in ((5.15)) the $\preceq$-sign by the $\leq$-sign, and add $b_{\varepsilon}(t)\left(\|\mathbf{u}\|_{2}^{2}+\|\mathrm{D} \mathbf{u}\|_{2}^{2}\right)$ to the right hand side of (5.15).

## 6 Contribution of the Pressure Terms

In this section, we study the integrals obtained by restricting the terms $\mathcal{E}_{1}, \mathcal{E}_{2}$, and $\mathcal{E}_{3}$ in (4.1) to their pressure parts, i.e. $\partial_{1} \pi, \frac{1}{\xi_{1}} \partial_{2} \pi$, and $\partial_{3} \pi$, respectively. Thus, we consider

$$
\left\{\begin{array}{l}
I_{1,1}(\pi):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left[\partial_{\rho_{0}}\left(\xi_{1} \partial_{1} \pi\right)\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{6.1}\\
I_{1,2}(\pi):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{2 \pi}\left[\partial_{1}\left(\partial_{2} \pi\right)\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
I_{1,3}(\pi):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left[\partial_{\rho_{0}}\left(\partial_{3} \pi\right)\right] \cdot\left[\partial_{1} u_{3}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
I_{j, 2}(\pi):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{j}\left(\frac{1}{\xi_{1}} \partial_{2} \pi\right)\right] \cdot\left[\partial_{j} u_{2}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, j=2,3 \\
I_{j, k}(\pi):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{j}\left(\partial_{k} \pi\right)\right] \cdot\left[\partial_{j} u_{k}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, j=2,3, k=1,3
\end{array}\right.
$$

In order to handle the pressure terms, we consider the three sums

$$
I_{j}(\pi):=I_{j, 1}(\pi)+I_{j, 2}(\pi)+I_{j, 3}(\pi), j=1,2,3 .
$$

This crucial device allows us to exploit the incompressibility of the velocity field $\mathbf{u}$.
With the help of straightforward calculations, by appealing to the boundary conditions, and with suitable integrations by parts, we show that

$$
\begin{equation*}
I_{1}(\pi)=-\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{\rho_{1}}\left[\partial_{1} \pi\right] \cdot \partial_{1}[\nabla \cdot \mathbf{u}] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}+\stackrel{\circ}{I}_{1,1}(\pi) \tag{6.2}
\end{equation*}
$$

where

$$
\stackrel{\circ}{I}_{1,1}(\pi):=\left.\int_{0}^{1} \int_{0}^{2 \pi}\left[\xi_{1} \partial_{1} \pi\right] \cdot\left[\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} u_{1}\right)\right]\right|_{\substack{\xi_{1}=\rho_{0}}} ^{\substack{\xi_{1}=\rho_{1} \\ \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\ \hline}}
$$

The volume integral on the right hand side of (6.2) vanishes due to $\nabla \cdot \mathbf{u} \equiv 0$. Hence,

$$
I_{1}(\pi)=\circ_{1,1}(\pi)
$$

and we are left to study the boundary integral $\circ_{1,1}(\pi)$.
Similar calculations show that

$$
I_{2}(\pi)=I_{3}(\pi)=0 .
$$

We now turn to treating the remaining boundary integral $\circ_{1,1}(\pi)$.
Lemma 6.1. The boundary integral

$$
\stackrel{\circ}{I}_{1,1}(\pi)=\left.\int_{0}^{1} \int_{0}^{2 \pi}\left[\partial_{1} \pi\right] \cdot\left[\partial_{1}\left(\xi_{1} u_{1}\right)\right]\right|_{\substack{\xi_{1}=\rho_{0}}} ^{\substack{\xi_{1}=\rho_{1} \\ \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\ \hline \\ \hline}}
$$

is negligible in the sense that there holds

$$
\left|\stackrel{\circ}{I}_{1,1}(\pi)\right| \leq b_{\varepsilon}(t) \cdot\|\mathbf{D} \mathbf{u}\|_{2}^{2}+\varepsilon \cdot\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}
$$

Proof. According to equations $(2.4)_{1}$ and $(2.6)_{1}$, we have

$$
\partial_{1} \pi=-\partial_{t} u_{1}-\mathbf{u} \cdot \nabla u_{1}+\frac{u_{2}^{2}}{\xi_{1}}+\nu\left(\nabla^{2} u_{1}-\frac{2}{\xi_{1}^{2}} \partial_{2} u_{2}-\frac{u_{1}}{\xi_{1}^{2}}\right) .
$$

First, we evaluate this equation for $\xi_{1}=\rho_{0}, \rho_{1}$, using the boundary condition $u_{1}=0$, and, thus, as a consequence, that also the tangential derivatives $\partial_{i} u_{1}, \partial_{i} \partial_{j} u_{1}, i, j=2,3$, vanish for $\xi_{1}=\rho_{0}, \rho_{1}$. Hence, we get

$$
\partial_{t} u_{1}=0, \quad \mathbf{u} \cdot \nabla u_{1}=0, \quad \text { and } \quad \nabla^{2} u_{1}=\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right),
$$

and that leads to

$$
\partial_{1} \pi=\nu \cdot \frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right)-\nu \frac{2}{\xi_{1}^{2}} \partial_{2} u_{2}+\frac{u_{2}^{2}}{\xi_{1}} \text { on } \partial^{l} \Omega .
$$

Since $\xi_{1} \partial_{1} u_{1}=\partial_{1}\left(\xi_{1} u_{1}\right)-u_{1}$ and $\nabla \cdot \mathbf{u}=0$, we get

$$
\begin{aligned}
\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right) & =\frac{1}{\xi_{1}} \partial_{1}\left(-\partial_{2} u_{2}-\xi_{1} \partial_{3} u_{3}-u_{1}\right) \\
& =-\frac{1}{\xi_{1}} \cdot \partial_{2}\left(\partial_{1} u_{2}\right)-\frac{1}{\xi_{1}} \cdot \partial_{3} u_{3}-\frac{1}{\xi_{1}} \cdot \xi_{1} \cdot \partial_{3} \partial_{1} u_{3}-\frac{1}{\xi_{1}} \cdot \partial_{1} u_{1}
\end{aligned}
$$

Now, we use the boundary conditions for $u_{2}$ and $u_{3}$ and get

$$
\partial_{3} \partial_{1} u_{3}=0 \quad \text { and } \quad \partial_{2} \partial_{1}\left(\frac{u_{2}}{\xi_{1}}\right)=0 .
$$

This leads to

$$
\begin{equation*}
\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right)=-\frac{1}{\xi_{1}^{2}}\left(\partial_{2} u_{2}\right)-\frac{1}{\xi_{1}}\left(\partial_{3} u_{3}\right)-\frac{1}{\xi_{1}}\left(\partial_{1} u_{1}\right) \tag{6.3}
\end{equation*}
$$

and, because $\partial_{1} u_{1}=\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} u_{1}\right)$ with $u_{1}=0$, the right-hand side of (6.3) equals $-\frac{1}{\xi_{1}} \nabla \cdot u$ and, therefore, vanishes. So we finally arrive at

$$
\partial_{1} \pi=-\frac{2 \nu}{\xi_{1}^{2}} \partial_{2} u_{2}+\frac{u_{2}^{2}}{\xi_{1}}
$$

The second factor in the integrand is

$$
\partial_{1}\left(\xi_{1} u_{1}\right)=-\partial_{2} u_{2}-\xi_{1} \partial_{3} u_{3},
$$

hence, we have

$$
\stackrel{\circ}{I}_{1,1}(\pi)=\left.\int_{0}^{1} \int_{0}^{2 \pi}\left[-\frac{2 \nu}{\xi_{1}^{2}} \partial_{2} u_{2}+\frac{u_{2}^{2}}{\xi_{1}}\right] \cdot\left[-\partial_{2} u_{2}-\xi_{1} \partial_{3} u_{3}\right]\right|_{\substack{\xi_{1}=\rho_{0}}} ^{\xi_{1}=\rho_{1}} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} .
$$

We now expand the product and consider the four appearing summands.
For the integrals over $\left|\partial_{2} u_{2}\right|^{2}$ and $\partial_{2} u_{2} \cdot \partial_{3} u_{3}$, we use Gagliardo's trace theorem and get

$$
\begin{align*}
\left.\int_{0}^{1} \int_{0}^{2 \pi}|\mathrm{Du}|^{2}\right|_{\xi_{1}=\rho_{0}} ^{\xi_{1}=\rho_{1}} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} & \leq c\left\||\mathrm{Du}|^{2}\right\|_{1,1}  \tag{6.4}\\
& \leq c\left(\|\mathrm{Du}\|_{2}^{2}+\left\||\mathrm{D} \mathbf{u}|\left|\mathrm{D}^{2} \mathbf{u}\right|\right\|_{1}\right) \\
& \leq c\|\mathrm{Du}\|_{2}^{2}+C(\varepsilon) \cdot\|\mathrm{D} \mathbf{u}\|_{2}^{2}+\varepsilon \cdot\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}
\end{align*}
$$

Here, $\|\cdot\|_{1,1}$ denotes the $W^{1,1}(\Omega)$-norm.
The integral with the integrand

$$
\frac{1}{\xi_{1}} u_{2}^{2}\left(\partial_{2} u_{2}\right)
$$

vanishes because

$$
u_{2}^{2}\left(\partial_{2} u_{2}\right)=\frac{1}{3} \partial_{2}\left(u_{2}^{3}\right),
$$

and we can integrate by parts with respect to $\xi_{2}$.
Finally, we consider

$$
\begin{aligned}
& -\left.\int_{0}^{1} \int_{0}^{2 \pi}\left(\frac{1}{\xi_{1}} \cdot u_{2}^{2}\right) \cdot\left(\xi_{1} \partial_{3} u_{3}\right)\right|_{\xi_{1}=\rho_{0}} ^{\xi_{1}=\rho_{1}} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{1} \partial_{1}\left[u_{2}^{2} \cdot\left(\partial_{3} u_{3}\right)\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
= & -\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{12 \pi \rho_{1}} 2 u_{2}\left(\partial_{1} u_{2}\right)\left(\partial_{3} u_{3}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}-\int_{0} \int_{0} \int_{\rho_{0}}^{2} u_{2}^{2} \partial_{3} \partial_{1} u_{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{aligned}
$$

The first integral is of type (4.6d), and the second integral is of type (4.6c). Integrals of these types have been treated in Lemma 4.2.

The above Lemma and the fact that all volume integrals, if summed up suitably, vanish identically lead to the following result.

Theorem 6.2. All pressure terms $I_{j, k}(\pi)$ are negligible.

## 7 Contribution of the Viscous Terms

To estimate the contribution of the viscous terms in equations (4.1), we consider the nine integrals obtained by restricting the terms $\mathcal{E}_{1}, \mathcal{E}_{2}, \mathcal{E}_{3}$ to their respective viscous parts. For instance,

$$
\begin{align*}
& I_{1,1}(\nu):=  \tag{7.1}\\
& -\nu \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\xi_{1}\left(\nabla^{2} u_{1}-\frac{2}{\xi_{1}^{2}} \partial_{2} u_{2}-\frac{u_{1}}{\xi_{1}^{2}}\right)\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{align*}
$$

The two "lower order terms" in the expression

$$
\nabla^{2} u_{1}-\frac{2}{\xi_{1}^{2}} \partial_{2} u_{2}-\frac{u_{1}}{\xi_{1}^{2}}
$$

clearly generate negligible quantities. Thus, we drop these two terms in equation (7.1) 1,1 and instead investigate the integral

$$
\begin{align*}
& I_{1,1}\left(\nabla^{2}\right):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\xi_{1} \cdot \nabla^{2} u_{1}\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{7.2}\\
& =\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right)+\frac{1}{\xi_{1}} \partial_{2}^{2} u_{1}+\xi_{1} \partial_{3}^{2} u_{1}\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} .
\end{align*}
$$

In the same way, we obtain integrals $I_{j, k}\left(\nabla^{2}\right), j, k=1,2,3$, that we will refer to with equation numbers $(7.2)_{j, k}, j, k=1,2,3$.

In order to obtain integrands of the form $\left|\partial_{i} \partial_{j} u_{1}\right|^{2}, i, j=1,2,3$, we separate the three terms which make up the right hand side of equation $(7.2)_{1,1}$. Hence, we write

$$
I_{1,1}\left(\nabla^{2}\right)=I_{1,1}^{1}\left(\nabla^{2}\right)+I_{1,1}^{2}\left(\nabla^{2}\right)+I_{1,1}^{3}\left(\nabla^{2}\right),
$$

where the upper index $l=1,2,3$ indicates that, in the right hand side of $(7.2)_{1,1}$, we have only considered the $l$-th term of the decomposition of the expression $\xi_{1}\left(\nabla^{2} u_{1}\right)$. Subsequently, we integrate by parts: the first term with respect to $\xi_{1}$, the second one with respect to $\xi_{2}$, and the third
one with respect to $\xi_{3}$. We start with the $\xi_{1}$-term:

$$
\begin{align*}
I_{1,1}^{1}\left(\nabla^{2}\right) & :=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right)\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{7.3}\\
& =-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right)\right] \cdot \partial_{1}\left[\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{align*}
$$

because the boundary integral

$$
\left.\int_{0}^{1} \int_{0}^{2 \pi}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{1}\right)\right] \cdot\left[\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} u_{1}\right)\right]\right|_{\xi_{1}=\rho_{0}} ^{\substack{\xi_{1}=\rho_{1} \\ \mathrm{~d} \xi_{2} \\ \mathrm{~d} \\ \xi_{3}}}
$$

disappears, since the first factor vanishes identically. We have already established this fact whilst deriving equation (6.3).

For the second part of the Laplacian, we get

$$
\begin{align*}
I_{1,1}^{2}\left(\nabla^{2}\right) & :=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \partial_{\rho_{0}}\left[\frac{1}{\xi_{1}} \partial_{2}^{2} u_{1}\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{7.3}\\
& =-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\frac{1}{\xi_{1}} \partial_{2} u_{1}\right] \cdot\left[\frac{1}{\xi_{1}} \partial_{2}\left(\partial_{1}\left(\xi_{1} u_{1}\right)\right)\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{align*}
$$

because the boundary integral vanishes due to periodicity in $\xi_{2}$.
Integration by parts with respect to $\xi_{3}$ yields

$$
\begin{align*}
I_{1,1}^{3}\left(\nabla^{2}\right) & :=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\xi_{1} \partial_{3}^{2} u_{1}\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{7.3}\\
& =-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\xi_{1} \partial_{3} u_{1}\right] \cdot\left[\frac{1}{\xi_{1}} \partial_{3}\left(\partial_{1}\left(\xi_{1} u_{1}\right)\right)\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{align*}
$$

because $\mathbf{u}$ is periodic in $\xi_{3}$.
From (7.3), it looks clear that

$$
I_{1,1}^{l}\left(\nabla^{2}\right) \simeq-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left|\partial_{l} \partial_{1} u_{1}\right|^{2} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \simeq-c\left\|\partial_{l} \partial_{1} u_{1}\right\|_{2}^{2}, l=1,2,3
$$

We can argue similarly to show the following result.
Proposition 7.1. One has

$$
I_{j, k}^{l}\left(\nabla^{2}\right) \simeq-c\left\|\partial_{l} \partial_{j} u_{k}\right\|_{2}^{2}, j, k, l=1,2,3 .
$$

Proof. The integral (7.2) 1,1 $^{\text {has already been considered. The other eight integrals can be handled }}$ in the same manner. After a decomposition of each integral in three summands, the respective first summands should be integrated by parts with respect to $\xi_{1}$, the respective second summands with respect to $\xi_{2}$, and the respective third summands with respect to $\xi_{3}$. Integrating by part with respect to $\xi_{2}$ or $\xi_{3}$ does not lead to boundary integrals due to the periodicity in the corresponding variables. Therefore, we only check the remaining eight first summands that contain an integration by parts with respect to $\xi_{1}$. One has

$$
\begin{aligned}
I_{1,2}^{1}\left(\nabla^{2}\right) & :=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{1}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{2}\right)\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& =-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{0}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{2}\right)\right] \cdot \partial_{1}\left[\xi_{1} \partial_{1} \frac{u_{2}}{\xi_{1}}\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
\end{aligned}
$$

because the boundary integral

$$
\left.\int_{0}^{1} \int_{0}^{2 \pi}\left[\partial_{1}\left(\xi_{1} \partial_{1} u_{2}\right)\right] \cdot\left[\xi_{1} \partial_{1} \frac{u_{2}}{\xi_{1}}\right]\right|_{\xi_{1}=\rho_{0}} ^{\xi_{1}=\rho_{1}} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
$$

vanishes, since $\partial_{1} \frac{u_{2}}{\xi_{1}} \equiv 0$ on $\partial^{l} \Omega$.
The terms $I_{1,3}^{1}\left(\nabla^{2}\right), I_{2,1}^{1}\left(\nabla^{2}\right)$, and $I_{3,1}^{1}\left(\nabla^{2}\right)$ lead to boundary integrals that vanish for the same reason, namely $\partial_{1} u_{3} \equiv \partial_{2} u_{1} \equiv \partial_{3} u_{1} \equiv 0$ on $\partial^{l} \Omega$.
$I_{2,2}^{1}\left(\nabla^{2}\right)$ and $I_{3,2}^{1}\left(\nabla^{2}\right)$ lead to boundary integrals that contain first order derivatives only. In fact,

$$
\begin{aligned}
I_{2,2}^{1}\left(\nabla^{2}\right):= & -\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{1} u_{2}\right] \cdot \partial_{1}\left[\partial_{2} u_{2}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& +\left.\int_{0}^{1} \int_{0}^{2 \pi} \partial_{2}\left[\partial_{1} u_{2}\right] \cdot\left[\partial_{2} u_{2}\right] \cdot \xi_{1}\right|_{\substack{\xi_{1}=\rho_{1} \\
\mathrm{~d} \xi_{2} \mathrm{~d} \xi_{0}}} ^{\xi_{1} .}
\end{aligned}
$$

However, due to the fact that

$$
\begin{equation*}
\partial_{1} u_{2}=\xi_{1} \cdot\left(\partial_{1} \frac{u_{2}}{\xi_{1}}\right)+\frac{u_{2}}{\xi_{1}} \tag{7.4}
\end{equation*}
$$

and $\partial_{1} \frac{u_{2}}{\xi_{1}} \equiv 0$ on $\partial^{l} \Omega$, we obtain the identity $\partial_{2}\left(\partial_{1} u_{2}\right)=\frac{\partial_{2} u_{2}}{\xi_{1}}$ on $\partial^{l} \Omega$ and arrive at a boundary integral that is quadratic in a first order derivative.

More precisely, we get

$$
\begin{align*}
I_{2,2}^{1}\left(\nabla^{2}\right)= & -\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \partial_{2}\left[\partial_{1} u_{2}\right] \cdot \partial_{1}\left[\partial_{2} u_{2}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{7.5}\\
& +\int_{0}^{1} \int_{0}^{2 \pi}\left|\partial_{2} u_{2}\right|^{2}{\begin{array}{c}
\xi_{1}=\rho_{1} \\
\mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} . \\
\xi_{1}=\rho_{0}
\end{array}}^{\xi_{0} .}
\end{align*}
$$

The boundary integral in (7.5) is negligible; this was shown in (6.4).
The term $I_{3,2}^{1}\left(\nabla^{2}\right)$ can be treated in the exact same manner, simply by replacing $\partial_{2}$ by $\partial_{3}$ in each step.

Regarding $I_{2,3}^{1}\left(\nabla^{2}\right)$, after an integration by parts, we arrive at

$$
I_{2,3}^{1}\left(\nabla^{2}\right):=-\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2} \partial_{2}\left[\xi_{1} \partial_{1} u_{3}\right] \cdot \partial_{1}\left[\partial_{2} u_{3}\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3},
$$

since the boundary integral, namely

$$
\left.\int_{0}^{1} \int_{0}^{2 \pi} \partial_{2}\left[\xi_{1} \partial_{1} u_{3}\right] \cdot\left[\partial_{2} u_{3}\right]\right|_{\xi_{1}=\rho_{0}} ^{\xi_{1}=\rho_{1}} \begin{gathered}
\mathrm{d} \xi_{2} \mathrm{~d} \xi_{3},
\end{gathered}
$$

vanishes due to the condition $\partial_{2}\left(\partial_{1} u_{3}\right) \equiv 0$ on $\partial^{l} \Omega$ in the integrand's first factor.
Considering $I_{3,3}^{1}\left(\nabla^{2}\right)$, we can argue in the very same manner if we appeal to the condition $\partial_{3}\left(\partial_{1} u_{3}\right) \equiv 0$ on $\partial^{l} \Omega$. Hence,

$$
I_{3,3}^{1}\left(\nabla^{2}\right):=-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\xi_{1} \partial_{1} u_{3}\right] \cdot \partial_{1}\left[\partial_{3} u_{3}\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
$$

since, as mentioned before, the boundary integral,

$$
\left.\int_{0}^{1} \int_{0}^{2 \pi} \partial_{3}\left[\xi_{1} \partial_{1} u_{3}\right] \cdot\left[\partial_{3} u_{3}\right]\right|_{\xi_{1}=\rho_{0}} ^{\xi_{1}=\rho_{1}} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3},
$$

vanishes.
The proof of Proposition 7.1 shows that the following result holds.
Theorem 7.2. One has

$$
\begin{equation*}
\sum_{j, k} I_{j, k}(\nu) \simeq \nu\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}, \tag{7.6}
\end{equation*}
$$

uniformly in $t$ for almost all $t \in(0, T)$.

## 8 Contribution of the Time Derivatives

In this section, we study the integrals obtained by restricting the terms $\mathcal{E}_{1}, \mathcal{E}_{2}$, and $\mathcal{E}_{3}$ in (4.1) to the time derivatives, $\partial_{t} u_{k}, k=1,2,3$, of the velocity.

Hence, we consider

$$
\left\{\begin{array}{l}
I_{1,1}\left(\partial_{t}\right):=\iint_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{1}\left(\xi_{1} \partial_{t} u_{1}\right)\right] \cdot\left[\frac{1}{\xi_{1}^{2}} \partial_{1}\left(\xi_{1} u_{1}\right)\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3},  \tag{8.1}\\
I_{1,2}\left(\partial_{t}\right):=\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{0}\left[\partial_{1}\left(\xi_{1} \partial_{t} u_{2}\right)\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, \\
I_{1,3}\left(\partial_{t}\right):=\int_{0}^{12 \pi \rho_{1}} \int_{0}^{2} \int_{0}\left[\partial_{1}\left(\partial_{t} u_{3}\right)\right] \cdot\left[\partial_{1} u_{3}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, \\
I_{j, k}\left(\partial_{t}\right):=\iint_{0}^{12 \pi \rho_{1}} \int_{0} \int_{\rho_{0}}\left[\partial_{j}\left(\partial_{t} u_{k}\right)\right] \cdot\left[\partial_{j} u_{k}\right] \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, j=2,3, k=1,2,3 .
\end{array}\right.
$$

Except for the consideration of $(8.1)_{1,1}$ and $(8.1)_{1,2}$, this leads to integrals of the form

$$
\begin{equation*}
I_{j, k}\left(\partial_{t}\right)=\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{j} u_{k}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, \tag{8.2}
\end{equation*}
$$

and these are the quantities that we need in the main inequality (3.7) (with $\|\mathbf{u}\|_{p}^{q}$ replaced by $\left.\|\overline{\mathbf{u}}\|_{p}^{q}\right)$.

Straightforward calculations show that the integrand of (8.1) $)_{1,1}$ reads

$$
\begin{align*}
& \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\left[\xi_{1}^{2}\left(\partial_{1} u_{1}\right)^{2}+2 \xi_{1} u_{1}\left(\partial_{1} u_{1}\right)+u_{1}^{2}\right] \frac{1}{\xi_{1}}= \\
& \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\left[\left(\partial_{1} u_{1}\right)^{2}\right] \xi_{1}+\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\left[\left(\partial_{1}\left(u_{1}^{2}\right)\right]+\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \frac{1}{\xi_{1}} u_{1}^{2}\right. \tag{8.3}
\end{align*}
$$

The first term on the right hand side of (8.3) gives the integral

$$
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{1} u_{1}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3},
$$

and this is of the form that we need in (3.7) (with $\|\mathbf{u}\|_{p}^{q}$ replaced by $\|\overline{\mathbf{u}}\|_{p}^{q}$ ).

The integral of the second term in (8.3),

$$
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left[\partial_{\rho_{0}}\left(u_{1}^{2}\right)\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
$$

vanishes as we can integrate by parts with respect to $\xi_{1}$ and use the boundary condition $u_{1}=0$ on $\partial^{l} \Omega$ for all $t \in(0, T)$.

We have proved that

$$
\begin{equation*}
I_{1,1}\left(\partial_{t}\right) \simeq \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{1} u_{1}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}+\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{\rho_{1}}} \frac{u_{1}^{2}}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}, \tag{8.4}
\end{equation*}
$$

where the second term on the right hand side is the integral of the third term in (8.3). We note that, in the sequel, this term will appear on the left hand side of our equation of type (3.7). Further, in $\S 9$, the application of Gronwall's Lemma in the proof of the main theorem will give the additional conclusion $u_{1} \in L^{\infty}\left(0, T ; L^{2}(\Omega)\right)$.

The integral (8.1) 1,2 $^{2}$ must be treated differently because, now, the integrand differs from $(1 / 2) \partial_{t}\left(\partial_{1} u_{2}\right)^{2}$ by terms that cannot be handled in the way above. Therefore, we proceed in the following way:

$$
\partial_{1}\left(\xi_{1} \partial_{t} u_{2}\right)=\partial_{t}\left[\partial_{1}\left(\xi_{1}^{2} \cdot \frac{u_{2}}{\xi_{1}}\right)\right]=\partial_{t}\left[2 \xi_{1} \cdot \frac{u_{2}}{\xi_{1}}+\xi_{1}^{2}\left(\partial_{1} \frac{u_{2}}{\xi_{1}}\right)\right]
$$

and the integrand of $(8.1)_{1,2}$ can be rewritten in the form

$$
\left[\partial_{1}\left(\xi_{1} \partial_{t} u_{2}\right)\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \cdot \xi_{1}=\frac{1}{2} \partial_{t}\left(\left|\partial_{1} \frac{u_{2}}{\xi_{1}}\right|^{2}\right) \cdot \xi_{1}^{3}+2\left(\partial_{t} u_{2}\right)\left(\partial_{1} u_{2}\right)-\frac{2}{\xi_{1}}\left(\partial_{t} u_{2}\right) u_{2}
$$

Thus, we have

$$
\begin{align*}
I_{1,2}\left(\partial_{t}\right)= & \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left|\partial_{\rho_{0}} \frac{u_{2}}{\xi_{1}}\right|^{2} \cdot \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& +2 \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{2 \pi \rho_{1}}\left(\partial_{t} u_{2}\right)\left(\partial_{1} u_{2}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{8.5}\\
& -\frac{\mathrm{d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2} u_{2}^{2} \cdot \frac{1}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=: I_{1,2}^{1}\left(\partial_{t}\right)+2 I_{1,2}^{2}\left(\partial_{t}\right)-I_{1,2}^{3}\left(\partial_{t}\right)
\end{align*}
$$

The term $I_{1,2}^{3}\left(\partial_{t}\right)$ will be easily estimated, since it is integrable on $(0, T)$ because the weak solution belongs to $L^{2}\left(0, T ; L^{2}(\Omega)\right)$.

Proposition 8.1. The term $I_{1,2}^{2}\left(\partial_{t}\right)$ is negligible.
Proof. In order to estimate $I_{1,2}^{2}\left(\partial_{t}\right)$, we replace $\partial_{t} u_{2}$ according to the equation of motion $(2.4)_{2}$ :

$$
\begin{equation*}
\partial_{t} u_{2}=-(\mathbf{u} \cdot \nabla) u_{2}-\frac{u_{1} u_{2}}{\xi_{1}}+\nu\left(\nabla^{2} u_{2}+\frac{2}{\xi_{1}^{2}} \partial_{2} u_{1}-\frac{u_{2}}{\xi_{1}^{2}}\right)-\frac{1}{\xi_{1}} \partial_{2} \pi \tag{8.6}
\end{equation*}
$$

An integration of $\left(\partial_{t} u_{2}\right)\left(\partial_{1} u_{2}\right)$ then leads to integrals of types which we already treated in Lemma 4.2, except for the integral that contains the pressure:

$$
\begin{equation*}
-\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi}\left[\frac{1}{\xi_{1}} \partial_{2} \pi\right] \cdot\left[\partial_{1} \frac{u_{2}}{\xi_{1}}\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \leq c\|\nabla \pi\|_{2}\|\mathrm{D} \mathbf{u}\|_{2} \tag{8.7}
\end{equation*}
$$

On the other hand, by scalar multiplication of $\mathcal{E}_{1} \cdot \mathbf{e}_{1}+\mathcal{E}_{2} \cdot \mathbf{e}_{2}+\mathcal{E}_{3} \cdot \mathbf{e}_{3}=0$ by $\nabla \pi$, we get

$$
\begin{equation*}
\langle\nabla \pi, \nabla \pi\rangle=-\left\langle\partial_{t} \mathbf{u}, \nabla \pi\right\rangle-\langle N(\mathbf{u}), \nabla \pi\rangle+\langle\nu(\mathbf{u}), \nabla \pi\rangle . \tag{8.8}
\end{equation*}
$$

When, subsequently, integrating (8.8) over $\Omega$, we note that the first summand on the right hand side vanishes:

$$
\begin{aligned}
& \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2}\left\langle\partial_{t} \mathbf{u}, \nabla \pi\right\rangle \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
= & \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left\{\left[\left(\partial_{t} u_{1}\right) \cdot \partial_{1} \pi\right]+\left[\left(\partial_{t} u_{2}\right) \cdot \frac{\partial_{2} \pi}{\xi_{1}}\right]+\left[\left(\partial_{t} u_{3}\right) \cdot \partial_{3} \pi\right]\right\} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
= & -\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\partial_{1}\left(\xi_{1} \partial_{t} u_{1}\right)+\partial_{2}\left(\partial_{t} u_{2}\right)+\xi_{1} \partial_{3}\left(\partial_{t} u_{3}\right)\right] \cdot \pi \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0
\end{aligned}
$$

because $\nabla \cdot\left(\partial_{t} \mathbf{u}\right)=0$. Note that the boundary integrals vanish, again, since, when integrating with respect to $\xi_{1}$, we can exploit $\partial_{t} u_{1}=0$ on $\partial^{l} \Omega$ and, when integrating with respect to $\xi_{2}$ and $\xi_{3}$, we can draw on the periodicity in these variables.

Therefore, we have

$$
\begin{equation*}
\|\nabla \pi\|_{2} \leq c\left(\|N(\mathbf{u})\|_{2}+\|\nu(\mathbf{u})\|_{2}\right) \tag{8.9}
\end{equation*}
$$

So,

$$
\|\nabla \pi\|_{2}\|\mathrm{Du}\|_{2} \leq c\left(\|N(\mathbf{u})\|_{2}+\|\nu(\mathbf{u})\|_{2}\right)\|\mathrm{D} \mathbf{u}\|_{2} \preceq c\|N(\mathbf{u})\|_{2}\|\mathrm{D} \mathbf{u}\|_{2}
$$

as $\|\nu(\mathbf{u})\|_{2}\|\mathrm{D} \mathbf{u}\|_{2} \preceq c\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}\|\mathrm{D} \mathbf{u}\|_{2}$ is negligible. By appealing to (4.7), it follows that

$$
\|\nabla \pi\|_{2}\|\mathrm{Du}\|_{2} \preceq c\|\mathrm{D} \mathbf{u}\|_{2}^{5 / 2}\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{1 / 2}
$$

By Young's equality with exponents $4 / 3$ and 4 , we obtain

$$
\|\nabla \pi\|_{2}\|\mathrm{Du}\|_{2} \preceq C(\varepsilon)\|\mathrm{Du}\|_{2}^{4 / 3}\|\mathrm{D} \mathbf{u}\|_{2}^{2}+\varepsilon\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}
$$

The desired result follows as $\mathrm{D} \mathbf{u} \in L^{2}\left(0, T ; L^{2}(\Omega)\right) \subset L^{4 / 3}\left(0, T ; L^{2}(\Omega)\right)$.
We have proved that

$$
\begin{align*}
I_{1,2}\left(\partial_{t}\right) \simeq & \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left(\partial_{1} \frac{u_{2}}{\xi_{1}}\right)^{2} \cdot \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& -\frac{\mathrm{d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{2} u_{2}^{2} \cdot \frac{1}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{8.10}
\end{align*}
$$

From $(8.2)_{j, k},(8.4)$, and (8.10), we get the following result.
Theorem 8.2. For the time terms, one gets, with $I_{j, k}\left(\partial_{t}\right)$ as in $(8.2)_{j, k}$,

$$
\begin{aligned}
& \sum_{j, k=1,2,3} I_{j, k}\left(\partial_{t}\right) \simeq \\
& \sum_{(j, k) \neq(1,2)} \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{j} u_{k}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& +\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{1} \frac{u_{2}}{\xi_{1}}\right|^{2} \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& +\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \frac{u_{1}^{2}}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}-\frac{\mathrm{d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{\rho_{0}}} \frac{u_{2}^{2}}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} .
\end{aligned}
$$

## 9 The Core Estimate. Related Remarks.

The aim of this section is twofold: We give the core estimate - actually, in more than one explicit form - , and we also explain how - and why - we will proceed in the sequel. These explanations should be helpful for the readers.

The integrals $I_{j, k}(\mathcal{E})$ of the basic identities (4.1) have been split up according to (4.3) into four distinct parts: time, pressure, non-linear and viscous terms. These quantities have been estimated in $\S \S 5-8$, cf. Theorems 5.7, 6.2, 7.2, and 8.2. Adding up these inequalities according to (4.4) gives the following main result.

Theorem 9.1. The estimate

$$
\begin{align*}
& \sum_{(j, k) \neq(1,2)} \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left|\partial_{j} u_{k}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& +\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \iint_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{1} \frac{u_{2}}{\xi_{1}}\right|^{2} \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{9.1}\\
& +\nu\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}+\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \frac{u_{1}^{2}}{\xi_{0}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}-\frac{\mathrm{d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{2} u_{2}^{2} \cdot \frac{1}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& \leq C(\varepsilon)\|\overline{\mathbf{u}}\|_{p}^{q}\|\mathrm{Du}\|_{2}^{2}+b_{\varepsilon}(t)\left(\|\mathbf{u}\|_{2}^{2}+\|\mathrm{Du}\|_{2}^{2}\right)+\varepsilon\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}
\end{align*}
$$

holds for almost all $t \in(0, T)$.
Note that, by inserting, on the right hand side, the $b_{\varepsilon}$-term, we were allowed to replace the symbol " $\preceq$ " by " $\leq$ ". Equation (9.1), up to secondary terms, enjoys the canonical structure of equation (3.7). In view of the application of Gronwall's lemma, an apparent main difference is that, on the left hand side of (9.1), one has

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{1} \frac{u_{2}}{\xi_{1}}\right|^{2} \cdot \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{9.2}
\end{equation*}
$$

instead of

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi}\left(\partial_{1} u_{2}\right)^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{9.3}
\end{equation*}
$$

but, on the right hand side of the same inequality, one must have

$$
\begin{equation*}
\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left|\partial_{\rho_{0}} \frac{u_{2}}{\xi_{1}}\right|^{2} \cdot \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{9.4}
\end{equation*}
$$

instead of

$$
\begin{equation*}
\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left(\partial_{1} u_{2}\right)^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{9.5}
\end{equation*}
$$

We overcome this obstacle by appealing to the following result.
Lemma 9.2. One has the following equivalence up to negligible terms.

$$
\begin{equation*}
\int_{0}^{1} \int_{0}^{2 \pi \rho_{\rho_{0}}}\left(\partial_{1} \frac{u_{2}}{\xi_{1}}\right)^{2} \cdot \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \simeq \int_{0}^{1} \int_{0}^{2 \pi \rho_{\rho_{1}}}\left(\partial_{1} u_{2}\right)^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{9.6}
\end{equation*}
$$

The proof follows immediately from the identity

$$
\begin{equation*}
\left(\partial_{1}\left(u_{2} / \xi_{1}\right)\right)^{2} \xi_{1}^{3}=\left(\partial_{1} u_{2}\right)^{2} \xi_{1}-2 u_{2}\left(\partial_{1} u_{2}\right)+u_{2}^{2} / \xi_{1} \tag{9.7}
\end{equation*}
$$

Since the two terms in (9.4) and (9.5) are equivalent, and $\left\|\partial_{1} u_{2}\right\|_{2}^{2}$ still appears on the right hand side of (9.1), we may add $\left\|\partial_{1}\left(u_{2} / \xi_{1}\right)\right\|_{2}^{2}$ to this same right hand side. So we will show, by appealing to Gronwall's Lemma, that

$$
\partial_{1} \frac{u_{2}}{\xi_{1}} \in L^{\infty}\left(0, T ; L^{2}(\Omega)\right)
$$

Using Lemma 9.2 once more, we will obtain, in particular, that

$$
\partial_{1} u_{2} \in L^{\infty}\left(0, T ; L^{2}(\Omega)\right)
$$

which is the desired result.
Therefore, we define, in addition to $\|\mathrm{Du}\|_{2}^{2}$, the quite similar quantity

$$
\begin{align*}
\|\tilde{D} \mathbf{u}\|_{2}^{2}=\sum_{(j, k) \neq(1,2)} & \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|\partial_{j} u_{k}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{9.8}\\
& +\int_{0}^{12} \int_{0}^{2 \rho_{1}} \int_{\rho_{0}}\left|\partial_{1} u_{2}\right|^{2} \xi_{1}^{3} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} .
\end{align*}
$$

By appealing to (9.7), one shows that

$$
\begin{equation*}
\left|\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}-\|\mathrm{D} \mathbf{u}\|_{2}^{2}\right| \leq c\left(\|\mathbf{u}\|_{2}\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}+\|\mathbf{u}\|_{2}^{2}\right) \leq c\left(\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+\|\mathbf{u}\|_{2}^{2}\right) \tag{9.9}
\end{equation*}
$$

where we may replace, on the right hand side, D̃u by Du. The core argument is that (9.9) leads to the crucial estimate

$$
\begin{equation*}
\|\overline{\mathbf{u}}\|_{p}^{q}\|\mathrm{D} \mathbf{u}\|_{2}^{2} \leq\|\overline{\mathbf{u}}\|_{p}^{q}\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+c\left(\|\overline{\mathbf{u}}\|_{p}^{q}\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+\|\mathbf{u}\|_{2}^{2}\right) \tag{9.10}
\end{equation*}
$$

It is worth noting that, in the sequel, the equivalence would be not sufficient.
By setting $\varepsilon=\nu / 2$ in equation (9.1), and by taking into account equation (9.10), it readily follows that

$$
\begin{align*}
& \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2} \\
+ & \frac{\nu}{2}\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2} \\
+ & \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \frac{u_{1}^{2}}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{9.11}\\
- & \frac{\mathrm{d}}{\mathrm{~d} t} \int_{0}^{1} \iint_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \frac{u_{2}^{2}}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
\leq & B(t)\left(\|\mathbf{u}\|_{2}^{2}+\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}\right)
\end{align*}
$$

where, from now on, $B(t)$ denotes any generical non-negative real function satisfying

$$
B(t) \in L^{1}(0, T)
$$

Basically, equation (9.11) is well prepared to apply Gronwall's Lemma. However, there are two minor obstacles. The first one is the presence of the two last terms on the left hand side of (9.11), especially the one with the negative sign (actually, the other one is even helpful). The second point is that, in some cases of axial symmetry of $\Omega$, see [6], the quantities $\|\mathbf{u}\|_{2}^{2}+\|\mathrm{Du}\|_{2}^{2}$ and $\|\mathrm{Du}\|_{2}^{2}$ are not equivalent. In the present case, this concerns the third component. Hence, in order to control the term $\|\mathbf{u}\|_{2}^{2}$ on the right hand side of (9.1) by means of Gronwall's Lemma, we will add its time derivative to the left hand side, which is obtained from an energy type estimate. This additional term also allows us to control the above integral with the minus sign in front of it.

## 10 The Energy Inequality

According to (2.4), we define $\mathcal{E}_{j}\left(\partial_{t}\right), \mathcal{E}_{j}(N), \mathcal{E}_{j}(\nu)$, and $\mathcal{E}_{j}(\pi), j=1,2,3$, through the following identity

$$
\begin{equation*}
\mathcal{E}_{j}=\mathcal{E}_{j}\left(\partial_{t}\right)+\mathcal{E}_{j}(N)+\mathcal{E}_{j}(\nu)+\mathcal{E}_{j}(\pi), j=1,2,3 \tag{10.1}
\end{equation*}
$$

Note that $\mathcal{E}_{j}(N)=N_{j}$, cf. (2.6), and $\mathcal{E}_{j}\left(\partial_{t}\right)=\partial_{t} u_{j}$.
A full energy inequality is obtained by time integration of the main identity:

$$
\begin{equation*}
\sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{\rho_{1}} \mathcal{E}_{j} \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0 \tag{10.2}
\end{equation*}
$$

Since integrations by parts with respect to $\xi_{2}$ and $\xi_{3}$ always lead to vanishing boundary integrals due to periodicity, we will not treat these integrals explicitly.

Lemma 10.1. We have

$$
\begin{equation*}
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi} \mathcal{E}_{j}\left(\partial_{t}\right) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|u_{j}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \tag{10.3}
\end{equation*}
$$

Proof. Obvious.
Lemma 10.2. We have

$$
\begin{equation*}
\sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{\rho_{1}} \mathcal{E}_{j}(\pi) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0 \tag{10.4}
\end{equation*}
$$

Proof. For $j=1$, we obtain

$$
\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi \rho_{1}} \mathcal{E}_{1}(\pi) \cdot\left(\xi_{1} u_{1}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \iint_{\rho_{0}} \pi \cdot \partial_{1}\left(\xi_{1} u_{1}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
$$

since the boundary integral vanishes due to $u_{1}=0$ on $\partial^{l} \Omega$. For $j=2,3$, we proceed in an analogous manner. Now, the boundary integrals vanish due to periodicity. Summing up, we draw on the velocity's divergence-free property to obtain the desired result.

Lemma 10.3. We have

$$
\begin{equation*}
\sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} \mathcal{E}_{j}(N) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=0 \tag{10.5}
\end{equation*}
$$

Proof. One easilly shows that, for each $j=1,2,3$,

$$
\left(\mathbf{u} \cdot \nabla u_{j}\right)\left(\xi_{1} u_{j}\right)=\frac{1}{2}\left(\mathbf{u} \cdot \nabla u_{j}^{2}\right) \cdot \xi_{1} .
$$

Hence, the integral of each of the above terms vanishes according to Lemma 5.4. It follows that the integral on the left hand side of equation (10.5) consists merely of the two "lower order terms" appearing in $(2.6)_{1}$ and $(2.6)_{2}$. These terms cancel each other due to their opposite signs.

Next, we consider the viscous terms. We start by the "higher order terms". From (2.2c), one has

$$
\begin{equation*}
\nabla^{2} u_{j}=\frac{1}{\xi_{1}} \partial_{1}\left(\xi_{1} \partial_{1} u_{j}\right)+\frac{1}{\xi_{1}^{2}}\left(\partial_{2}^{2} u_{j}\right)+\left(\partial_{3}^{2} u_{j}\right) . \tag{10.6}
\end{equation*}
$$

Hence,

$$
\begin{align*}
& \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{\rho_{1}}\left(\nabla^{2} u_{j}\right) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=\int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi} \partial_{1}\left(\xi_{1} \partial_{1} u_{j}\right) \cdot u_{j} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
+ & \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{1}\left(\partial_{2}^{2} u_{j}\right) \cdot \frac{u_{j}}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}+\int_{0}^{2 \pi \rho_{1}} \int_{0} \int_{\rho_{0}}\left(\partial_{3}^{2} u_{j}\right) \cdot u_{j} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} . \tag{10.7}
\end{align*}
$$

By suitable integrations by parts, one shows that, for each $j=1,2,3$,

$$
\begin{aligned}
& \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left(\nabla^{2} u_{j}\right) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}=-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left(\partial_{1} u_{j}\right)^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
- & \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}^{1}\left(\partial_{2} u_{j}\right)^{2} \cdot \frac{1}{\xi_{1}} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}-\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left(\partial_{3} u_{j}\right)^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
+ & \int_{0}^{1} \int_{0}^{2 \pi}\left(\partial_{1} u_{j}\right) \cdot u_{j} \cdot \xi_{1} \left\lvert\, \begin{array}{c}
\xi_{1}=\rho_{1} \\
\mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} . \\
\xi_{1}=\rho_{0}
\end{array}\right.
\end{aligned}
$$

For $j=1$, the boundary integral vanishes due to $u_{1} \equiv 0$ on $\partial^{l} \Omega$. For $j=3$, the boundary integral vanishes, since $\partial_{1} u_{3} \equiv 0$ on $\partial^{l} \Omega$. Furthermore, for $j=2$, due to boundary condition $(2.9)_{2}$, one has $\partial_{1} u_{2}=u_{2} / \xi_{1}$ on $\partial^{l} \Omega$. Hence,

$$
\left.\left.\int_{0}^{1} \int_{0}^{2 \pi}\left(\partial_{1} u_{2}\right) \cdot u_{2} \cdot \xi_{1}\right|_{\xi_{1}=\rho_{0}} ^{\substack{\xi_{1}=\rho_{1} \\ d \xi_{2} \\ d \\ \xi_{3}}} \int_{0}^{1} \int_{0}^{2 \pi} u_{2}^{2}\right|_{\xi_{1}=\rho_{0}} ^{\xi_{1}=\rho_{1}} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}
$$

It readily follows that

$$
\begin{align*}
& \sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}}\left(\nabla^{2} u_{j}\right) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& =-  \tag{10.8}\\
& \sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left[\left(\partial_{1} u_{j}\right)^{2} \cdot \xi_{1}+\left(\partial_{2} u_{j}\right)^{2} \cdot \frac{1}{\xi_{1}}+\left(\partial_{3} u_{j}\right)^{2} \cdot \xi_{1}\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& \quad+\left.\int_{0}^{1} \int_{0}^{2 \pi} u_{2}^{2}\right|_{\substack{\xi_{1}=\rho_{1} \\
\mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
\xi_{1}=\rho_{0}}}
\end{align*}
$$

where the first integral is the principal part of the $\nu$-term.
The boundary integral can be estimated by appealing to Gagliardo's trace theorem. This immediately shows that

$$
\begin{align*}
& \left.\quad\left|\int_{0}^{1} \int_{0}^{2 \pi} u_{2}^{2}\right| \begin{array}{c}
\xi_{1}=\rho_{1} \\
\mathrm{~d} \xi_{2} \\
\xi_{1}=\rho_{0}
\end{array} \right\rvert\, \\
& \leq C \cdot\left\|u_{2}^{2}\right\|_{1,1} \\
& \leq C \cdot\left(\int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} u_{2}^{2} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}+\iint_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|u_{2} \cdot \mathrm{D} u_{2}\right| \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}\right)  \tag{10.9}\\
& \leq C \cdot\left(\|\mathbf{u}\|_{2}^{2}+\|\mathbf{u}\|_{2}\|\mathbf{D u}\|_{2}\right)
\end{align*}
$$

which is clearly a negligible term because

$$
\begin{equation*}
C \cdot\left(\|\mathbf{u}\|_{2}^{2}+\|\mathbf{u}\|_{2}\|\mathrm{D} \mathbf{u}\|_{2}\right) \leq C_{\varepsilon} \cdot\|\mathbf{u}\|_{2}^{2}+\varepsilon \cdot\|\mathrm{D} \mathbf{u}\|_{2}^{2} \tag{10.10}
\end{equation*}
$$

Next, we consider the "lower order terms" which are present for $j=1,2$, cf. $(2.4)_{1}$ and $(2.4)_{2}$. All these terms are clearly negligible. Hence, for the purpose of proving our main result, the reader does not have to take these terms into account. However, it might still by interesting for the reader to study their contribution in order to obtain a stringent energy inequality in the current context. Instead of appealing to negligibility, we might, therefore, note that the contribution of the "lower order terms" that have not been taken into account yet is bounded by the left hand side of (10.10), as can be easily verified by the reader. Hence, with an obvious $\varepsilon$-notation, one has, by appealing to (10.8), (10.9), and (10.10), the following statement.

Lemma 10.4. We have

$$
\begin{align*}
& \sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \mathcal{E}_{j}(\nu) \cdot\left(\xi_{1} u_{j}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
& \geq \nu \sum_{j=1}^{3} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{0}\left[\left(\partial_{1} u_{j}\right)^{2} \cdot \xi_{1}+\left(\partial_{2} u_{j}\right)^{2} \cdot \frac{1}{\xi_{1}}+\left(\partial_{3} u_{j}\right)^{2} \cdot \xi_{1}\right] \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{10.11}\\
& \quad-\nu \cdot\left(C_{\varepsilon} \cdot\|\mathbf{u}\|_{2}^{2}+\varepsilon \cdot\|\mathrm{Du}\|_{2}^{2}\right)
\end{align*}
$$

From the main identity 10.2 , by appealing to Lemma 10.1 - Lemma 10.4, one obtains the following energy inequality.

Theorem 10.5. One has

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\|\mathbf{u}\|^{2}+\frac{\nu}{2}\|\mathrm{D} \mathbf{u}\|_{2}^{2} \leq C \nu\|\mathbf{u}\|_{2}^{2} \tag{10.12}
\end{equation*}
$$

In particular,

$$
\begin{equation*}
\mathbf{u} \in L^{\infty}\left(0, T ; L^{2}(\Omega)\right) \cap L^{2}\left(0, T ; W^{1,2}(\Omega)\right) \tag{10.13}
\end{equation*}
$$

## 11 Proof of Theorem 2.2.

It looks convenient to write the equation (10.12) in the more explicit form

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi} \int_{\rho_{0}}^{2 \pi} \sum_{j=1}^{3}\left|u_{j}\right|^{2} \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}+\frac{\nu}{2}\|\mathrm{D} \mathbf{u}\|_{2}^{2} \leq C \nu\|\mathbf{u}\|_{2}^{2} \tag{11.1}
\end{equation*}
$$

Addition, side by side, of equation (9.11) with equation (11.1) multiplied by a suitable positive constant $\alpha$ (to control the previous integral with a minus sign in front of it), leads to the estimate

$$
\begin{align*}
& \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+\frac{\nu}{2}\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}+\alpha \frac{\nu}{2}\|\mathrm{Du}\|_{2}^{2} \\
+ & \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}} u_{1}^{2}\left(\alpha \xi_{1}+\frac{1}{\xi_{1}}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
+ & \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{0} u_{2}^{2}\left(\alpha \xi_{1}-\frac{2}{\xi_{1}}\right) \mathrm{d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3}  \tag{11.2}\\
+ & \frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t} \int_{0}^{1} \int_{0}^{2 \pi \rho_{1}} \int_{\rho_{0}}\left|u_{3}\right|^{2} \alpha \cdot \xi_{1} \mathrm{~d} \xi_{1} \mathrm{~d} \xi_{2} \mathrm{~d} \xi_{3} \\
\leq & B(t)\left(\|\mathbf{u}\|_{2}^{2}+\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}\right)
\end{align*}
$$

which is clearly suitable for the application of Gronwall's Lemma, up to minor obvious adaptations. Note that the right hand side of (11.1) has been incorporated in the right hand side of (11.2) by replacing $B(t)+C \nu \alpha$ simply by $B(t)$.

Next, fix $\alpha$ such that $\alpha \rho_{0}=1+2 / \rho_{1}$. Since $\rho_{0} \leq \xi_{1} \leq \rho_{1}$, it follows that

$$
\alpha \xi_{1}-\frac{2}{\xi_{1}} \geq 1
$$

For convenience, let us denote the three explicit space integrals on the left hand side of (11.2) by, respectively, $K_{1}^{2}, K_{2}^{2}$, and $K_{3}^{2}$, and let us introduce $\mathcal{K}^{2}=K_{1}^{2}+K_{2}^{2}+K_{3}^{2}$. Due to the above choice of $\alpha$, one has $K_{j}^{2} \simeq\left\|u_{j}\right\|_{2}^{2}$, for $j=1,2,3$, which means $\mathcal{K}^{2} \simeq\|\mathbf{u}\|_{2}^{2}$. It follows that

$$
\begin{equation*}
\frac{1}{2} \frac{\mathrm{~d}}{\mathrm{~d} t}\left(\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+\mathcal{K}^{2}\right)+\frac{\nu}{2}\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2}+\alpha \frac{\nu}{2}\|\mathrm{D} \mathbf{u}\|_{2}^{2} \leq B(t)\left(\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+\mathcal{K}^{2}\right) \tag{11.3}
\end{equation*}
$$

A classical argument, based on integration with respect to time of (11.3) and Gronwall's Lemma, shows that

$$
\left(\|\tilde{\mathrm{D}} \mathbf{u}\|_{2}^{2}+\mathcal{K}^{2}\right) \in L^{\infty}(0, T), \quad \text { and } \quad\left\|\mathrm{D}^{2} \mathbf{u}\right\|_{2}^{2} \in L^{1}(0, T)
$$

This is obviously equivalent to (2.11), namely

$$
\mathbf{u} \in L^{\infty}\left(0, T ; W^{1,2}(\Omega)\right) \cap L^{2}\left(0, T ; W^{2,2}(\Omega)\right)
$$

Theorem 2.2 is proved.
